Revised: 18.10.2022

Accepted: 05.11.2022

ABSTRACT: Aromatic pandanus leaves (*Pandanus amaryllifolius*) are known as cooking flavoring leaves because of their aroma and biological activities that are beneficial to health. So far, there is uncertainty in using young and fresh leaves and old leaves. The phytochemical composition of *P. amaryllifolius* on different leaf development was used as the target in this study. GC-MS analysis revealed 16 compounds in old leaves and 21 in young ones. This study categorizes the identified compounds into several classes: phenols, prenol lipids, steroids and steroid derivatives, fatty acyls, and other metabolites. The results showed that the compound 2,6,10,14,18,22-Tetracosahexaene,2,6,10,15,19,23-hexamethyl-,(al-E)- was most dominant in old leaves and young leaves at 45.84 % and 19.22 %, respectively. International library search results show that the compound has the potential as an anti-aging and anti-tumor.

Keywords: GC-MS, metabolite, *Pandanus amaryllifolius*, phytochemical

INTRODUCTION

Aromatic Pandanus (*Pandanus amaryllifolius*) is a tropical plant belonging to the family Pandanaceae (Omer et al. 2021) found in India, South China, and Southeast Asia, including Thailand (Saenthaweesuk et al., 2016). The middle leaves are pale green, slightly flabby, and grayish on the underside (Kiki Monita et al., 2021). Young leaves are bright green, and the tips of the leaves are pointed with a length of about 25-75 cm and a width of 2-5 cm (Bhuyan & Sonowal, 2021). *P. amaryllifolius* leaves in 3-month development are light green-dark green, with a smoother leaf surface, 20 cm long and 2 cm wide. Differs in the leaves of 1-year development of dark green-brownish color, whose surface is rougher, 52.1 cm long and 4 cm wide. This is similar to studies that show 1-year Pandanus in Southeast Asia, predominantly 40-80 cm tall with clustered growing leaves (Amnan et al., 2022). The structure of *P. amaryllifolius* has different characteristics

Figure 1. Leaves of *Pandanus amaryllifolius*; a) Age 12 months; (b) Age 3 months.

Pandan leaves are often used for medicine and seasoning in cooking because they have a unique and pleasant taste and aroma (Omer et al., 2021). The presence of 2-acetyl-1-pyrroline is thought to be an aromatic aroma-forming compound (Suryani et al., 2018; Wakte et al., 2010). Traditionally, Pandanus is considered a medicinal plant for the treatment of gout, hyperglycemia, hypertension,

and rheumatism (Cheng et al., 2017), antimicrobial (Simamora et al., 2021), antioxidant, antiviral (Nor et al., 2008), hypoglycemic (Ooi et al., 2004). Pandanus lowers fever and relieves indigestion and flatulence (Cheeptham & Towers, 2002). In addition, the inhibitory effect of tumor growth from Pandan was proven through a series of pharmacological studies (Peungvicha et al., 1998). *P. amaryllifolius* leaves contain essential oils, carotenoids, tocopherol and tocotrienol (Lee et al., 2004), alkaloids (Busqué et al., 2002), fatty acids and esters, and non-specific lipid transfer proteins (Ooi et al., 2004). Pandanus contains several important phytochemical constituents, such as saponins, tannins, alkaloids, flavonoids, terpenoids, and phenolics, that are relatively high (Thanebal et al., 2021). Flavonoids are one of the secondary metabolites (MS) that act as antioxidants (Anggraito et al., 2018; Hastiana et al., 2021). Pandan leaf extract can be used as a natural antioxidant, so synthetic antioxidants can be reduced by using pandan leaves (Magaretta et al., 2011).

Ingredients such as saponins, tannins, alkaloids, flavonoids, terpenoids, and phenolics are found in most plants, one of which is Maja or bael fruit (*Aegle marmelos*) (Wangkahart et al., 2022). *Aegle marmelos* can also be an excellent source of phenolic and flavonoid content, adding antioxidant and anti-inflammatory activity (Sonar & Rathod, 2020). Flavonoids are found more in leaves than Maja fruits' skin (Atika, 2021). The phytochemical content of each plant part varies because secondary metabolite compounds are closely related to the protective function of the plant itself (Syafitri et al., 2014; Wijayanti & Dewi, 2022). The results of the *Helianthus annuus* research study on the roots, stems, leaves, and seeds showed differences in bioactive compounds because each organ had different metabolic processes (Maslakhah et al., 2019; Nurmawati et al., 2022). So far, the part of the pandanus plant used is the leaf part. Although studies of secondary metabolites in pandanus leaves are widely reported, phytochemical variations in pandanus leaves of young development and old development are still rarely investigated. Using the

GC-MS analysis technique, this study will provide comprehensive information on variations in the content of secondary metabolite compounds in two types of *P. amaryllifolius* leaves. Therefore, the results of this study can be used as a reference in optimizing utilization in the next *P. amaryllifolius*.

MATERIALS AND METHODS

Preparation and Identification of Plant Material

Pandanus amaryllifolius leaves development of 3 months and 12 months were taken from farmers in Bogor Regency, Indonesia. Samples of *P. amaryllifolius* were identified and deposited in Botanical Identification Services (ELSA), National Research and Innovation Agency (BRIN), Indonesia, with specimens voucher number 3079-46085-3. Leaf picking is done by harvesting each part of the leaf directly and then putting it in a Coolerbox for extraction.

Extract preparation

All 50 g of fresh leaves were each washed thoroughly using running aquadest water. Each sample was oven-dried for 72 hours at 40 °C. Sample leaves are blended until smooth for further maceration. Ethanol 99.8 % analytical was used as a solvent at maceration for 92 hours. 10 ml of each sample extract was placed in a separate tube and dried at 60 °C using a Rotary Evaporator Caliper. The solid residue is re-dissolved with the remaining extract of 200 µL (Özbek et al., 2022).

GC-MS Analysis

GC-MS analysis was performed using Agilent Technologies 7890 Gas Chromatograph with Auto Sampler and 5975 Mass Selective Detector and Chemstation data system, following procedures performed by John Bwire Ochola (Ochola et al., 2022) and modified by the BALITRO (Spice and Medicinal Plants Research Center) library. Ethanol plant extract is filtered through a five µL syringe filter in split mode (8:1). Helium gas is used as a carrier at a rate of 1.2 mL/min. The injector temperature is 250 °C, then the analytes are separated on the silica capillary column (30 m × 0.20 mm I.D × 0.11 mm film thickness). The initial

oven temperature is set at 80 °C, which is raised to 150 °C at a rate of 3 °C/min. One minute later, the oven temperature is raised to 280 °C at a rate of 20 °C/min. Once the oven temperature reaches 280 °C, it is maintained for 26 minutes. Determination of the mass spectrum using an ionization energy of 70 eV.

Data Analysis

Agilent MassHunter Qualitative Analysis Software performed data analysis, and all components were identified by comparing their mass fragments with the standard mass spectrum. Biological activity data were analyzed using data from the chemistry libraries of NCBI (National Center for Biotechnology Information), NIST (National Institute of Standards and Technology), ChemSpider, WILEY Spectrabase branch, and TMIC (The Metabolomics Innovation Centre) FOOD3 branch (Tang et al., 2022).

RESULT

GC-MS analysis proves that *P. amaryllifolius* has different compound content at each development. Found 16 compounds in *P. amaryllifolius* of one-year development (Table 1), with the most compounds named 2,6,10,14,18,22-Tetracosahexaene, 2,6,10,15,19,23-hexamethyl-,(al-E)- as much as 45.84 % in leaves of 1-year development. In contrast to the 21 compounds in the leaves of 3-month development (Table 2), which only have 2,6,10,14,18,22-Tetracosahexaene, 2,6,10,15,19,23-hexamethyl-,(al-E)-, as much as 19,22 % as the most dominant compounds.

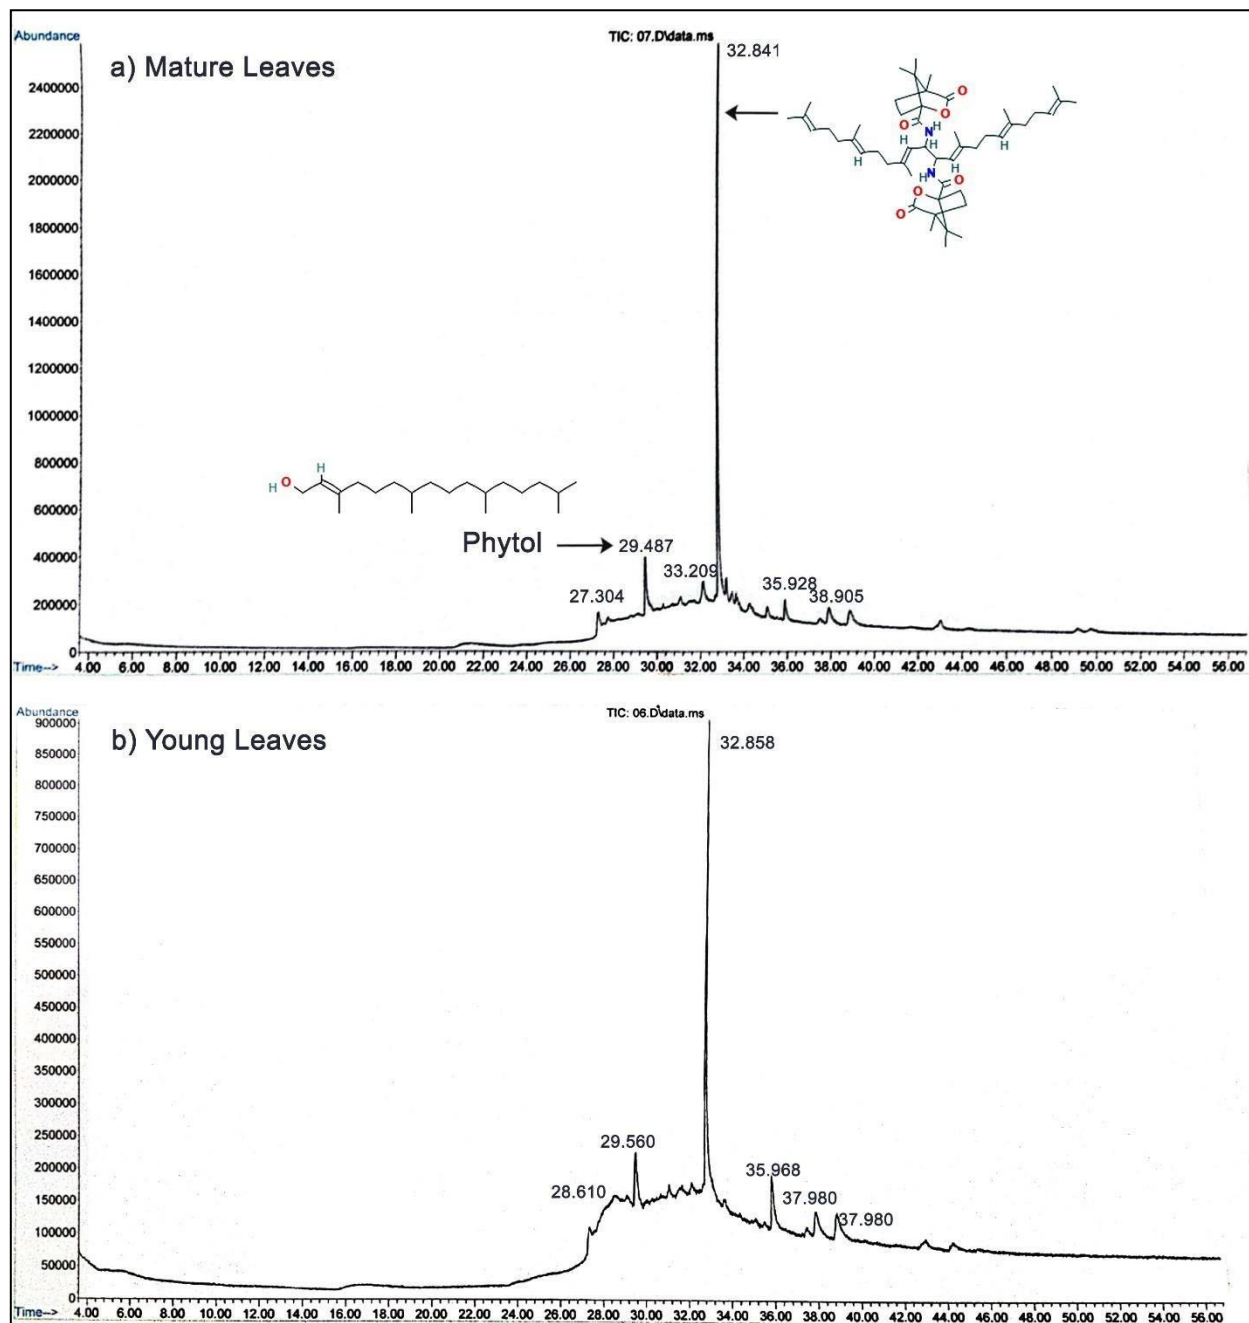

Figure 3. *Pandanus amaryllifolius* chromatogram as an output of GC-MS

The GC-MS analysis found the name of the metabolite compound based on Retention Time (RT) which describes the seconds of discovery of the compound

Table 1. *Pandanus amaryllifolius* leaves in the 12-month development

Metabolites Compound	RT	% of Area	M.F.	M.W. (g/mol)	Chemical Structure	Class

Note: RT (Retention Time); M.F (Molecules Formula); and M.W. (Molecules Weight)

The class of Prenol lipids, as the most class found in leaves aged 12 months, is known to have different benefits from the most classes found in leaves aged three months, namely the class of Prenol lipids and

Fatty Acyls with the same amount. Whereas, 2,6,10,14,18,22-Tetracosahexaene,2,6,10,15,19,23-hexamethyl-,(al-E)- as most compounds are from the class of prenil lipids, a subclass of triterpenoids. Other lipid prenil groups were also found in as many as 6 in leaves aged 12 months and 3 in three months. Benzyl (Dideuterated) methyl ethe compound as a minor

compound found in leaves aged 12 months and leaves aged three months that have Tricyclo [4.2.1.1 (2.5)] deca-3,7-diene-9,10-diol,9-methyl-,stereoisomer as the most minor compound. These compounds have never been reported in the literature and require further research.

Table 3. Comparison of chemical constituents of *Pandanus amaryllifolius* in different stages

Metabolite of Compound	3 months in RT extract	% of Area This suggests	12 months in RT ethanol is	% of Area quite good at
(2E)-3,7,11,15-Tetramethyl-2-hexadecen-1-ol	29,562	7.94	29,486	8.96
6- [.Alpha.- (P-tolyl) methylidene] hydrazino-5- (dimethylamino methylene)	32,451	10.29	32,609	10.45
2,6,10,14,18,22-Tetracosahexaene,2,6,10,15,19,23-hexamethyl-,(al-E)-	32,858	19.22	32,844	45.84
Stigmasterol	37,974	29.29	37,939	39.00

Pandanus amaryllifolius has a different ratio of compound content at each age. Through GCMS analysis, it is known that there are four compounds found at the 3 months and 12 months (Table 3). Compounds (2E)-3,7,11,15-Tetramethyl-2-hexadecen-1-ol,2,6,10,14,18,22-Tetracosahexaene,2,6,10,15,19, 23-hexamethyl-,(al-E)-, Stigmasterol, and 6-[.α.- (P-tolyl)methylidene] hydrazino-5- (dimethylamino methylene) have an increasing amount with age. It is known that the four compounds are from the class of prenol lipids, namely (2E)-3,7,11,15-Tetramethyl-2-hexadecen-1-ol, and 2,6,10,14,18,22-Tetracosahexaene,2,6,10,15,19, 23-hexamethyl-,(al-E)-.stigmasterol with steroid grade and steroid derivates. At the same time, the class of 6- [.A.- (P-tolyl) methylidene] hydrazino-5- (dimethylamino methylene) is not yet known.

DISCUSSION

Ethanol is used as an organic solvent with the excess extraction of phenolic compounds studied to be more selective than water (Sánchez-Gomar et al., 2022). Ethanol has an ethane chain whose one of the hydrogens is substituted by a hydroxy group (NCBI). With a molecular weight of 46.07 g/mol, it has a safety level

that is not harmful to the body. In various studies, ethanol is often used in dissolving extracts (Sánchez-Gomar et al., 2022). Ethanol can identify antioxidant content well in the extraction of mango, olive, and red wine leaves. Ethanol can also identify anti-inflammatories in a solution of *C. sativa* aeroponic root extract (Ferrini et al., 2022). It is even used to identify anticancer substances (Q. Yang et al., 2022). Ethanol can identify 16 compounds in 1-year development and

3 months in 3-month development of 12 months *amaryllifolius* leaf extract. This suggests ethanol is quite good at identifying the chemical substances contained in *P. amaryllifolius* leaf extract. *P. amaryllifolius* leaves extracts both dominated by compounds 2,6,10,14,18,22-Tetracosahexaene, 2,6,10,15,19, 23-hexamethyl-,(al-E)- with remarkable benefits. This compound is also referred to as squalene which has a linear hydrocarbon structure (Rogowska & Szakiel, 2021). Squalene is often found in many plants, such as olive oil, palm oil, and avocado, with levels that depend on plant conditions (Mousavi et al., 2022) and is often used in the pharmaceutical, nutraceutical, and cosmetic industries (Ali et al., 2022). Its primary function is as a precursor to the biosynthesis of sterols (Abuobeid et al., 2022), and triterpenoids (Mus et al., 2022) and beneficial for plants as an antioxidant (Mousavi et al., 2022) and the human body as an anti-aging, anti-fatigue, and anti-tumor (Liu et al., 2021).

The compound 2-Methyl-7-(3-pyridinyl)-1,2-oxazepane is dominant in the extract of *P. amaryllifolius* 3-month development by 18.91 %. The compound 2-Methyl-7-(3-pyridinyl)-1,2-oxazepane belongs to the group of 1,2-oxazepines (WILEY). However, no one has yet reported the biological activity of the compound. It is similar to 6- [.α.- (P-tolyl) methylidene] hydrazino-5- (dimethylamino methylene), which has never been reported. Similarly, the compound 7-(3-Butenyl)bicyclo[4.2.0] octa-1,3,5-triene of the benzenoid group (WILEY) has no specific biological activity. However, the benzenoid group and its derivatives predominantly produce a special aroma in

plants (A. Gonzalez et al., 2022). Benolenoid-class compounds are also found in *Prunus mume*, which produces a unique aroma in spring (Hao et al., 2022), and in *Petunia hybrida* flowers that emit a strong aroma at night (Fu et al., 2022), also found are the Polycyclic hydrocarbons (WILEY) group on the leaves of *P. amaryllifolius* 12 months development, namely, 1H-Indene, 5-butyl-6-hexyloctahydro-. The Polycyclic hydrocarbons group is also found in various studies, but the compound 1H-Indene, 5-butyl-6-hexyloctahydro-

still needs more research on its biological activity. There are only ten compounds at 1-year development and eight compounds at 3-month development whose biological activity has been reported (Table 4). Meanwhile, 17 other compounds have not been found and need further research on their biological activity, including 4 compounds on leaves 12 months and 13 compounds on leaves 3 months (Table 5).

Table 4. Biological activity of the active compound on *P. amaryllifolius*

No	Metabolite of Compound	Biological Activity
1	(2E)-3,7,11,15-Tetramethyl-2-hexadecen-1-ol	Antibacterial (Cai et al., 2022)
2	(2E, 6E)-3,7,11-Trimethyl-2,6,10-dodecatrien-1-ol	Anti-inflammatory (Mückter et al., 2022), antibiotic, and antibacterial (Oliveira et al., 2022).
3	(9E)-9-Octadecenoic acid	Antiproliferative (Ak et al., 2021), Anti-inflammatory, (Alzahrani et al., 2021) and ansiolitik (Fattuoni et al., 2020)

17	1H-Indene, 5-butyl-6-hexyloctahydro-	12 months	Unknown

Table 5. The active compound of *P. amaryllifolius* leaves that have not been identified as biological activities

In the GC-MS analysis, even phytosterol components were found in *P. amaryllifolius* extracts through ethanol solvents. The phytosterol components (plant sterols) (Wang et al., 2022) have biological functions that are beneficial to the human body, such as anti-tumor (Karim et al., 2022), anticancer, antioxidant (Hernawati et al., 2021), and antimicrobial (Ramses et al., 2021; Wang et al., 2022). Stigmasterol was the main phytosterol in both samples, with more in *P. amaryllifolius* extract in 12 months of development. Stigmasterol effectively prevents Alzheimer's disease (Gładkowski et al., 2022) and is supported by research (Hussein et al., 2022), which shows that Stigmasterol can reduce the damaging effects of γ radiation. Other phytosterol components are also found in a 12 months developmental extract of *P. amaryllifolius* named β -sitosterol as an anti-inflammatory (Tunit et al., 2022), and antidiabetic (Afifi et al., 2022), γ sitosterol as anti-aging (Younis et al., 2022) and anticancer (Sánchez-Hernández et al., 2022). This comparison shows that 12 months developmental leaves have higher antioxidant benefits than 3-month development.

The compound (9E)-9-Octadecenoic acid (elaidic acid) in *P. amaryllifolius* extract progressed for three months as much as 6.19 %, reported to have anti-

inflammatory functions (Alzahrani et al., 2021), and

anxiolytics (Fattuoni et al., 2020). The compound (9E)-9-Octadecenoic acid is used in treating inflammation due to COVID-19 infection (Alzahrani et al., 2021). This shows (9E)-9-Octadecenoic acid is very effective in dealing with human inflammation, such as the compound β -sitosterol found in leaves of 3-month development. Anti-inflammatory substances were found in as many as four compounds in the leaves of 1-year development, namely (2E,6E)-3,7,11-Trimethyl-2,6,10-dodecatrien-1-ol, 2,6,10-Dodecatrien-1-ol,3,7,11,trimethyl-, 9H-Fluoren-9-one,hydrazone, dl- α -Tocopherol. This shows 1-year developmental leaves have higher anti-inflammatory levels. Especially in the compounds (2E,6E)-3,7,11-Trimethyl-2,6,10-dodecatrien-1-ol, and 2,6,10-Dodecatrien-1-ol,3,7,11,trimethyl- which belongs to the farnesol group with natural hydrophobic properties (Mückter et al., 2022), and as aromatic compounds (Sommer et al., 2022). Research on farnesol has proven its effectiveness as an antibiotic, antibacterial (Oliveira et al., 2022), and anti-inflammatory (Mückter et al., 2022).

dl- α -Tocopherol has other properties, namely as an antioxidant, as well as the function of compounds classified as tocopherol (Vitamin E) (Sun et al., 2022), such as carotene compounds (pro-vitamin A), coenzyme Q-10, L-carnitine, DL- α -tocopherol acetate (vitamin E), and ascorbic acid reported in the study (Daia et al.,

2021). The compound 9H-Fluoren-9-one,hydrazone is often found as a component of anticancer drugs (Huff et al., 2022). The four compounds identified as anti-inflammatory substances contain other beneficial benefits.

The compound (2E)-3,7,11,15-Tetramethyl-2-hexadecen-1-ol or phytol has antibiotic properties (Cai et al., 2022) and belongs to the diterpenoid group (Wu et al., 2021). Phytol is found in various plants, namely *Populus sp.* (Wu et al., 2021) and *Vigna unguiculata* (L.) Walp. (Perchuk et al., 2020). Interestingly, phytol is found in higher and low-level plants such as the microalgae *Scenedesmus sp.* (Apani et al., 2021). Phytol has many benefits, as well as the diterpenoid group in the study (Chen et al., 2022), which has biological activities in the form of analgesics, anti-inflammatories, antiepileptics, and antidepressants. The various biological activities compounds show that *P. amaryllifolius* leaves can be used as cooking ingredients and to maintain a healthy body.

CONCLUSION

Pandanus amaryllifolius leaves are an essential plant used as a flavoring for dishes and traditional medicinal materials. The differences in components in the leaves of *P. amaryllifolius* have never been studied before. In this study, GC-MS analysis found 16 compounds in the development of *P. amaryllifolius* leaves aged 12 months and 21 in 3 months of development. The most common compound in both samples was named 2,6,10,14,18,22-Tetracosahexaene,2,6,10,15,19,23-hexamethyl-,(al-E)- or squalene which is beneficial for enhancing the immune response, anti-aging, anti-fatigue, and anti-tumor. There are four similar compounds in both leaves, with the increasing age of metabolite content in pandan leaves increasing in age 12 months. Compound 6-[.Alpha.- (P-tolyl)methylidene] hydrazino-5-(dimethylamino methylene) only appeared at the age of 3 months, when the function and class of this compound were not yet known. The international library found a wide range of biological activities beneficial to human

health. Our results confirm that *P. amaryllifolius* leaves at 12 months and three months of development can be utilized for human health.
